

Session 21: Post class test solutions

1. **a. Mature companies with separable, stand alone assets.** Growth assets and interrelated assets are difficult to value in asset based valuation.
2. **e. A relative valuation of assets in place.** Relative valuation works better than intrinsic valuation at estimating what you can get for the assets in the market place today. You cannot liquidate growth assets.
3. **d. To estimate the relative value of assets in place,** Since fair value accounting requires you to estimate what a market participant will pay for an asset in an arms-length transaction rather than the value of the asset, it is really a relative valuation assessment. And since growth is entirely in the future, it is difficult to see how you can fair value that number and put it on an accounting balance sheet.
4. **c. \$3,650 million.** To estimate the value of each business, you first have to estimate the reinvestment rate:

Reinvestment rate = Expected growth rate/ ROIC

The value can then be estimated as follows:

Value = Expected EBIT (1-t) (1- Reinvestment rate)/ (Cost of capital -g)

| Business | EBIT (1-t) | ROIC | Reinvestment rate | Cost of capital | Value |
|------------|------------|------|-------------------|-----------------|-------|
| Steel | 150 | 9% | 33.33% | 8% | 2000 |
| Chemicals | 100 | 12% | 25.00% | 9% | 1250 |
| Technology | 50 | 15% | 20.00% | 13% | 400 |
| Company | | | | | 3650 |

5. **c. \$3,500 million.** Value the company first by estimating the value of the businesses:

| Business | EBITDA | EV/EBITDA multiple | |
|------------|--------|--------------------|------|
| Steel | 300 | 8 | 2400 |
| Chemicals | 200 | 5 | 1000 |
| Technology | 100 | 6 | 600 |
| | | | 4000 |

Value of equity = 4000 + 1000 - 500 = \$3,500 million
