Should you hedge?

☐ The value of this mine is very much a function iron ore prices. There are futures, forward and option markets iron ore that Vale can use to hedge against price movements. Should it?
   - Yes
   - No
   Explain.

☐ The value of the mine is also a function of exchange rates. There are forward, futures and options markets on currency. Should Vale hedge against exchange rate risk?
   - Yes
   - No
   Explain.

☐ On the last question, would your answer have been different if the mine were in Brazil?
   - Yes
   - No
Will the benefits persist if investors hedge the risk instead of the firm?

No

Hedge this risk. The benefits to the firm will exceed the costs

Yes

Let the risk pass through to investors and let them hedge the risk.

Can marginal investors hedge this risk cheaper than the firm can?

Yes

Hedge this risk. The benefits to the firm will exceed the costs

No

Indifferent to hedging risk

What is the cost to the firm of hedging this risk?

Negligible

High

Is there a significant benefit in terms of higher cash flows or a lower discount rate?

Yes

Hedge this risk. The benefits to the firm will exceed the costs

No

Indifferent to hedging risk

Is there a significant benefit in terms of higher expected cash flows or a lower discount rate?

Yes

Can marginal investors hedge this risk cheaper than the firm can?

No

Indifferent to hedging risk

Survival benefits (truncation risk)
- Protect against catastrophic risk
- Reduce default risk

Discount rate benefits
- Hedge "macro" risks (cost of equity)
- Reduce default risk (cost of debt or debt ratio)

Value Trade Off

Cash flow benefits
- Tax benefits
- Better project choices

Discount rate benefits

Pricing Trade

Aswath Damodaran
An acquisition is an investment/project like any other and all of the rules that apply to traditional investments should apply to acquisitions as well. In other words, for an acquisition to make sense:

- It should have positive NPV. The present value of the expected cash flows from the acquisition should exceed the price paid on the acquisition.
- The IRR of the cash flows to the firm (equity) from the acquisition > Cost of capital (equity) on the acquisition.

In estimating the cash flows on the acquisition, we should count in any possible cash flows from synergy.

The discount rate to assess the present value should be based upon the risk of the investment (target company) and not the entity considering the investment (acquiring company).
Tata Motors and Harman International

- Harman International is a publicly traded US firm that manufactures high end audio equipment. Tata Motors is an automobile company, based in India.
- Tata Motors is considering an acquisition of Harman, with an eye on using its audio equipment in its Indian automobiles, as optional upgrades on new cars.
Estimating the Cost of Capital for the Acquisition (no synergy)

1. **Currency**: Estimated in US $, since cash flows will be estimated in US $.
2. **Beta**: Harman International is an electronic company and we use the unlevered beta (1.17) of electronics companies in the US.
3. **Equity Risk Premium**: Computed based on Harman’s operating exposure:

<table>
<thead>
<tr>
<th>Region</th>
<th>Revenues: 2012-13 (in millions)</th>
<th>ERP</th>
<th>Weight</th>
<th>Weight *ERP</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States</td>
<td>$1,181</td>
<td>5.50%</td>
<td>27.48%</td>
<td>1.51%</td>
</tr>
<tr>
<td>Germany</td>
<td>$1,482</td>
<td>5.50%</td>
<td>34.48%</td>
<td>1.90%</td>
</tr>
<tr>
<td>Rest of Europe</td>
<td>$819</td>
<td>7.02%</td>
<td>19.06%</td>
<td>1.34%</td>
</tr>
<tr>
<td>Asia</td>
<td>$816</td>
<td>7.27%</td>
<td>18.99%</td>
<td>1.38%</td>
</tr>
<tr>
<td><strong>Harman</strong></td>
<td><strong>$4,298</strong></td>
<td>100.00%</td>
<td>100.00%</td>
<td>6.13%</td>
</tr>
</tbody>
</table>

4. **Debt ratio & cost of debt**: Tata Motors plans to assume the existing debt of Harman International and to preserve Harman’s existing debt ratio. Harman currently has a debt (including lease commitments) to capital ratio of 7.39% (translating into a debt to equity ratio of 7.98%) and faces a pre-tax cost of debt of 4.75% (based on its BBB- rating).

   \[
   \text{Levered Beta} = 1.17 \times (1+ (1-.40) (.0798)) = 1.226 \\
   \text{Cost of Equity} = 2.75\% + 1.226 \times (6.13\%) = 10.26\% \\
   \text{Cost of Capital} = 10.26\% \times (1-.0739) + 4.75\% \times (1-.40) (.0739) = 9.67\% 
   \]
Operating Income: The firm reported operating income of $201.25 million on revenues of $4.30 billion for the year. Adding back non-recurring expenses (restructuring charge of $83.2 million in 2013) and adjusting income for the conversion of operating lease commitments to debt, we estimated an adjusted operating income of $313.2 million. The firm paid 18.21% of its income as taxes in 2013 and we will use this as the effective tax rate for the cash flows.

Reinvestment: Depreciation in 2013 amounted to $128.2 million, whereas capital expenditures and acquisitions for the year were $206.4 million. Non-cash working capital increased by $272.6 million during 2013 but was 13.54% of revenues in 2013.
Bringing in growth

- We will assume that Harman International is a mature firm, growing 2.75% in perpetuity.
- We assume that revenues, operating income, capital expenditures and depreciation will all grow 2.75% for the year and that the non-cash working capital remain 13.54% of revenues in future periods.

<table>
<thead>

<td>-$94.64</td>
<td>$166.85</td>
</tr>
</tbody>
</table>
Value of Harman International: Before Synergy

Earlier, we estimated the cost of capital of 9.67% as the right discount rate to apply in valuing Harman International and the cash flow to the firm of $166.85 million for 2014 (next year), assuming a 2.75% growth rate in revenues, operating income, depreciation, capital expenditures and total non-cash working capital. We also assumed that these cash flows would continue to grow 2.75% a year in perpetuity.

\[
\text{Value of Operating Assets} = \frac{\text{Expected Cashflow to the firm next year}}{\text{Cost of Capital} - \text{Stable growth rate}}
\]

\[
= \frac{166.85}{.0967 - .0275} = 2,476 \text{ million}
\]

Adding the cash balance of the firm ($515 million) and subtracting out the existing debt ($313 million, including the debt value of leases) yields the value of equity in the firm:

\[
\text{Value of Equity} = \text{Value of Operating Assets} + \text{Cash} - \text{Debt}
\]

\[
= 2,476 + 515 - 313 = 2,678 \text{ million}
\]

The market value of equity in Harman in November 2013 was $5,428 million.

To the extent that Tata Motors pays the market price, it will have to generate benefits from synergy that exceed $2750 million.

Aswath Damodaran
Measuring Investment Returns
II. Investment Interactions, Options and Remorse...

Life is too short for regrets, right?
Independent investments are the exception...

- In all of the examples we have used so far, the investments that we have analyzed have stood alone. Thus, our job was a simple one. Assess the expected cash flows on the investment and discount them at the right discount rate.

- In the real world, most investments are not independent. Taking an investment can often mean rejecting another investment at one extreme (mutually exclusive) to being locked in to take an investment in the future (pre-requisite).

- More generally, accepting an investment can create side costs for a firm’s existing investments in some cases and benefits for others.
I. Mutually Exclusive Investments

- We have looked at how best to assess a stand-alone investment and concluded that a good investment will have positive NPV and generate accounting returns (ROC and ROE) and IRR that exceed your costs (capital and equity).

- In some cases, though, firms may have to choose between investments because
  - They are mutually exclusive: Taking one investment makes the other one redundant because they both serve the same purpose
  - The firm has limited capital and cannot take every good investment (i.e., investments with positive NPV or high IRR).

- Using the two standard discounted cash flow measures, NPV and IRR, can yield different choices when choosing between investments.

*Aswath Damodaran*
Comparing Projects with the same (or similar) lives..

When comparing and choosing between investments with the same lives, we can:

- Compute the accounting returns (ROC, ROE) of the investments and pick the one with the higher returns.
- Compute the NPV of the investments and pick the one with the higher NPV.
- Compute the IRR of the investments and pick the one with the higher IRR.

While it is easy to see why accounting return measures can give different rankings (and choices) than the discounted cash flow approaches, you would expect NPV and IRR to yield consistent results since they are both time-weighted, incremental cash flow return measures.
Consider two projects with the following cash flows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Project 1 CF</th>
<th>Project 2 CF</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>-1000</td>
<td>-1000</td>
</tr>
<tr>
<td>1</td>
<td>800</td>
<td>200</td>
</tr>
<tr>
<td>2</td>
<td>1000</td>
<td>300</td>
</tr>
<tr>
<td>3</td>
<td>1300</td>
<td>400</td>
</tr>
<tr>
<td>4</td>
<td>-2200</td>
<td>500</td>
</tr>
</tbody>
</table>

Aswath Damodaran
Project’s NPV Profile
What do we do now?

- Project 1 has two internal rates of return. The first is 6.60%, whereas the second is 36.55%. Project 2 has one internal rate of return, about 12.8%.

- Why are there two internal rates of return on project 1?

- If your cost of capital is 12%, which investment would you accept?
  - a. Project 1
  - b. Project 2

- Explain.
Case 2: NPV versus IRR

**Project A**

Cash Flow  
$350,000  
$450,000  
$600,000  
$750,000

Investment  
$1,000,000

NPV = $467,937  
IRR = 33.66%

**Project B**

Cash Flow  
$3,000,000  
$3,500,000  
$4,500,000  
$5,500,000

Investment  
$10,000,000

NPV = $1,358,664  
IRR = 20.88%

Aswath Damodaran
Which one would you pick?

Assume that you can pick only one of these two projects. Your choice will clearly vary depending upon whether you look at NPV or IRR. You have enough money currently on hand to take either. Which one would you pick?

a. Project A. It gives me the bigger bang for the buck and more margin for error.

b. Project B. It creates more dollar value in my business.

If you pick A, what would your biggest concern be?

If you pick B, what would your biggest concern be?
Capital Rationing, Uncertainty and Choosing a Rule

- If a business has limited access to capital, has a stream of surplus value projects and faces more uncertainty in its project cash flows, it is much more likely to use IRR as its decision rule.
  - Small, high-growth companies and private businesses are much more likely to use IRR.
- If a business has substantial funds on hand, access to capital, limited surplus value projects, and more certainty on its project cash flows, it is much more likely to use NPV as its decision rule.
- As firms go public and grow, they are much more likely to gain from using NPV.
The sources of capital rationing...

<table>
<thead>
<tr>
<th>Cause</th>
<th>Number of firms</th>
<th>Percent of total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debt limit imposed by outside agreement</td>
<td>10</td>
<td>10.7</td>
</tr>
<tr>
<td>Debt limit placed by management external to firm</td>
<td>3</td>
<td>3.2</td>
</tr>
<tr>
<td>Limit placed on borrowing by internal management</td>
<td>65</td>
<td>69.1</td>
</tr>
<tr>
<td>Restrictive policy imposed on retained earnings</td>
<td>2</td>
<td>2.1</td>
</tr>
<tr>
<td>Maintenance of target EPS or PE ratio</td>
<td>14</td>
<td>14.9</td>
</tr>
</tbody>
</table>
The problem with the NPV rule, when there is capital rationing, is that it is a dollar value. It measures success in absolute terms.

The NPV can be converted into a relative measure by dividing by the initial investment. This is called the profitability index.

Profitability Index (PI) = NPV/Initial Investment

In the example described, the PI of the two projects would have been:

- PI of Project A = $467,937/1,000,000 = 46.79%
- PI of Project B = $1,358,664/10,000,000 = 13.59%
- Project A would have scored higher.
Case 3: NPV versus IRR

**Project A**

Cash Flow

$ 5,000,000  $ 4,000,000  $ 3,200,000  $ 3,000,000

Investment  $ 10,000,000

NPV = $1,191,712
IRR=21.41%

**Project B**

Cash Flow

$ 3,000,000  $ 3,500,000  $ 4,500,000  $ 5,500,000

Investment  $ 10,000,000

NPV = $1,358,664
IRR=20.88%
Why the difference?

- These projects are of the same scale. Both the NPV and IRR use time-weighted cash flows. Yet, the rankings are different. Why?

- Which one would you pick?
  a. Project A. It gives me the bigger bang for the buck and more margin for error.
  b. Project B. It creates more dollar value in my business.

Aswath Damodaran
NPV, IRR and the Reinvestment Rate
Assumption

- The NPV rule assumes that intermediate cash flows on the project get reinvested at the hurdle rate (which is based upon what projects of comparable risk should earn).

- The IRR rule assumes that intermediate cash flows on the project get reinvested at the IRR. Implicit is the assumption that the firm has an infinite stream of projects yielding similar IRRs.

- Conclusion: When the IRR is high (the project is creating significant surplus value) and the project life is long, the IRR will overstate the true return on the project.
Solution to Reinvestment Rate Problem

Figure 6.3: IRR versus Modified Internal Rate of Return

Cash Flow

<table>
<thead>
<tr>
<th></th>
<th>$300</th>
<th>$400</th>
<th>$500</th>
<th>$600</th>
</tr>
</thead>
</table>

Investment

<$1000>

\[
\begin{align*}
\text{Terminal Value} &= $2160 \\
\text{Internal Rate of Return} &= 24.89\% \\
\text{Modified Internal Rate of Return} &= 21.23\%
\end{align*}
\]
Why NPV and IRR may differ. Even if projects have the same lives

- A project can have only one NPV, whereas it can have more than one IRR.
- The NPV is a dollar surplus value, whereas the IRR is a percentage measure of return. The NPV is therefore likely to be larger for “large scale” projects, while the IRR is higher for “small-scale” projects.
- The NPV assumes that intermediate cash flows get reinvested at the “hurdle rate”, which is based upon what you can make on investments of comparable risk, while the IRR assumes that intermediate cash flows get reinvested at the “IRR”.

Aswath Damodaran
Comparing projects with different lives..

Project A

- $1000

$400 $400 $400 $400 $400

NPV of Project A = $442
IRR of Project A = 28.7%

Project B

- $1500

NPV of Project B = $478
IRR for Project B = 19.4%

Hurdle Rate for Both Projects = 12%

Aswath Damodaran
Why NPVs cannot be compared.. When projects have different lives.

- The net present values of mutually exclusive projects with different lives cannot be compared, since there is a bias towards longer-life projects. To compare the NPV, we have to
  - replicate the projects till they have the same life (or)
  - convert the net present values into annuities
- The IRR is unaffected by project life. We can choose the project with the higher IRR.
Solution 1: Project Replication

**Project A: Replicated**

```
$400  $400  $400  $400  $400  $400  $400  $400  $400  $400

-$1000

-$1000 (Replication)
```

NPV of Project A replicated = $ 693

**Project B**

```

-$1500
```

NPV of Project B = $ 478
Solution 2: Equivalent Annuities

- Equivalent Annuity for 5-year project
  \[ = $442 \times PV(A,12\%,5\text{ years}) \]
  \[ = $122.62 \]

- Equivalent Annuity for 10-year project
  \[ = $478 \times PV(A,12\%,10\text{ years}) \]
  \[ = $84.60 \]
What would you choose as your investment tool?

- Given the advantages/disadvantages outlined for each of the different decision rules, which one would you choose to adopt?
  a. Return on Investment (ROE, ROC)
  b. Payback or Discounted Payback
  c. Net Present Value
  d. Internal Rate of Return
  e. Profitability Index

- Do you think your choice has been affected by the events of the last quarter of 2008? If so, why? If not, why not?
What firms actually use ..

</tbody>
</table>
II. Side Costs and Benefits

- Most projects considered by any business create side costs and benefits for that business.
  - The side costs include the costs created by the use of resources that the business already owns (opportunity costs) and lost revenues for other projects that the firm may have.
  - The benefits that may not be captured in the traditional capital budgeting analysis include project synergies (where cash flow benefits may accrue to other projects) and options embedded in projects (including the options to delay, expand or abandon a project).
- The returns on a project should incorporate these costs and benefits.
A. Opportunity Cost

- An opportunity cost arises when a project uses a resource that may already have been paid for by the firm.

- When a resource that is already owned by a firm is being considered for use in a project, this resource has to be priced on its next best alternative use, which may be:
  - a sale of the asset, in which case the opportunity cost is the expected proceeds from the sale, net of any capital gains taxes
  - renting or leasing the asset out, in which case the opportunity cost is the expected present value of the after-tax rental or lease revenues.
  - use elsewhere in the business, in which case the opportunity cost is the cost of replacing it.
Case 1: Foregone Sale?

Assume that Disney owns land in Rio already. This land is undeveloped and was acquired several years ago for $5 million for a hotel that was never built. It is anticipated, if this theme park is built, that this land will be used to build the offices for Disney Rio. The land currently can be sold for $40 million, though that would create a capital gain (which will be taxed at 20%). In assessing the theme park, which of the following would you do:

- Ignore the cost of the land, since Disney owns its already
- Use the book value of the land, which is $5 million
- Use the market value of the land, which is $40 million
- Other:
Case 2: Incremental Cost?
An Online Retailing Venture for Bookscape

- The initial investment needed to start the service, including the installation of additional phone lines and computer equipment, will be $1 million. These investments are expected to have a life of four years, at which point they will have no salvage value. The investments will be depreciated straight line over the four-year life.

- The revenues in the first year are expected to be $1.5 million, growing 20% in year two, and 10% in the two years following. The cost of the books will be 60% of the revenues in each of the four years.

- The salaries and other benefits for the employees are estimated to be $150,000 in year one, and grow 10% a year for the following three years.

- The working capital, which includes the inventory of books needed for the service and the accounts receivable will be 10% of the revenues; the investments in working capital have to be made at the beginning of each year. At the end of year 4, the entire working capital is assumed to be salvaged.

- The tax rate on income is expected to be 40%.
We will re-estimate the beta for this online project by looking at publicly traded online retailers. The unlevered total beta of online retailers is 3.02, and we assume that this project will be funded with the same mix of debt and equity (D/E = 21.41%, Debt/Capital = 17.63%) that Bookscape uses in the rest of the business. We will assume that Bookscape’s tax rate (40%) and pretax cost of debt (4.05%) apply to this project.

\[
\text{Levered Beta}_{\text{Online Service}} = 3.02 \left[ 1 + (1 - 0.4) (0.2141) \right] = 3.41
\]

\[
\text{Cost of Equity}_{\text{Online Service}} = 2.75\% + 3.41 \times 5.5\% = 21.48\%
\]

\[
\text{Cost of Capital}_{\text{Online Service}} = 21.48\% \times 0.8237 + 4.05\% \times (1 - 0.4) \times 0.1763 = 18.12\%
\]

This is much higher than the cost of capital (10.30%) we computed for Bookscape earlier, but it reflects the higher risk of the online retail venture.
### Incremental Cash flows on Investment

**NPV of investment = $76,375**
The side costs...

- It is estimated that the additional business associated with online ordering and the administration of the service itself will add to the workload for the current general manager of the bookstore. As a consequence, the salary of the general manager will be increased from $100,000 to $120,000 next year; it is expected to grow 5 percent a year after that for the remaining three years of the online venture. After the online venture is ended in the fourth year, the manager’s salary will revert back to its old levels.

- It is also estimated that Bookscape Online will utilize an office that is currently used to store financial records. The records will be moved to a bank vault, which will cost $1000 a year to rent.

Aswath Damodaran
