Recapping the Cost of Capital

\[
\text{Cost of Capital} = \left( \frac{\text{Cost of Equity}}{\text{Debt} + \text{Equity}} \right) + \left( \frac{\text{Cost of Borrowing}}{\text{Debt} + \text{Equity}} \right)(1-t)
\]

Cost of borrowing should be based upon:
1. synthetic or actual bond rating
2. default spread

Cost of Borrowing = Riskfree rate + Default spread

Weights should be market value weights

Marginal tax rate, reflecting tax benefits of debt
II. ESTIMATING CASH FLOWS

Cash is king...
Steps in Cash Flow Estimation

- Estimate the current earnings of the firm
  - If looking at cash flows to equity, look at earnings after interest expenses - i.e. net income
  - If looking at cash flows to the firm, look at operating earnings after taxes

- Consider how much the firm invested to create future growth
  - If the investment is not expensed, it will be categorized as capital expenditures. To the extent that depreciation provides a cash flow, it will cover some of these expenditures.
  - Increasing working capital needs are also investments for future growth

- If looking at cash flows to equity, consider the cash flows from net debt issues (debt issued - debt repaid)
Measuring Cash Flows

Cash flows can be measured to

All claimholders in the firm

- EBIT (1 - tax rate)
- (Capital Expenditures - Depreciation)
- Change in non-cash working capital
= Free Cash Flow to Firm (FCFF)

Just Equity Investors

- Net Income
- (Capital Expenditures - Depreciation)
- Change in non-cash Working Capital
- (Principal Repaid - New Debt Issues)
- Preferred Dividend

Dividends + Stock Buybacks
Measuring Cash Flow to the Firm

EBIT (1 - tax rate)
- (Capital Expenditures - Depreciation)
- Change in Working Capital

= Cash flow to the firm

Where are the tax savings from interest payments in this cash flow?

Measuring Earnings

Update
- Trailing Earnings
- Unofficial numbers
I. Update Earnings

- When valuing companies, we often depend upon financial statements for inputs on earnings and assets. Annual reports are often outdated and can be updated by using:
  - Trailing 12-month data, constructed from quarterly earnings reports.
  - Informal and unofficial news reports, if quarterly reports are unavailable.

- Updating makes the most difference for smaller and more volatile firms, as well as for firms that have undergone significant restructuring.

- Time saver: To get a trailing 12-month number, all you need is one 10K and one 10Q (example third quarter). Use the Year to date numbers from the 10Q:
  - Trailing 12-month Revenue = Revenues (in last 10K) - Revenues from first 3 quarters of last year + Revenues from first 3 quarters of this year.
II. Correcting Accounting Earnings

- Make sure that there are no financial expenses mixed in with operating expenses
  - Financial expense: Any commitment that is tax deductible that you have to meet no matter what your operating results: Failure to meet it leads to loss of control of the business.
  - Example: Operating Leases: While accounting convention treats operating leases as operating expenses, they are really financial expenses and need to be reclassified as such. This has no effect on equity earnings but does change the operating earnings.

- Make sure that there are no capital expenses mixed in with the operating expenses
  - Capital expense: Any expense that is expected to generate benefits over multiple periods.
  - R & D Adjustment: Since R&D is a capital expenditure (rather than an operating expense), the operating income has to be adjusted to reflect its treatment.
The Magnitude of Operating Leases

Operating Lease expenses as % of Operating Income

- Restaurants:

Aswath Damodaran
Dealing with Operating Lease Expenses

- Operating Lease Expenses are treated as operating expenses in computing operating income. In reality, operating lease expenses should be treated as financing expenses, with the following adjustments to earnings and capital:
  - Debt Value of Operating Leases = Present value of Operating Lease Commitments at the pre-tax cost of debt
  - When you convert operating leases into debt, you also create an asset to counter it of exactly the same value.

- Adjusted Operating Earnings
  - Adjusted Operating Earnings = Operating Earnings + Operating Lease Expenses - Depreciation on Leased Asset

As an approximation, this works:
  - Adjusted Operating Earnings = Operating Earnings + Pre-tax cost of Debt * PV of Operating Leases.
The Gap has conventional debt of about $1.97 billion on its balance sheet and its pre-tax cost of debt is about 6%. Its operating lease payments in the 2003 were $978 million and its commitments for the future are below:

<table>
<thead>
<tr>
<th>Year</th>
<th>Commitment (millions)</th>
<th>Present Value (at 6%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$899.00</td>
<td>$848.11</td>
</tr>
<tr>
<td>2</td>
<td>$846.00</td>
<td>$752.94</td>
</tr>
<tr>
<td>3</td>
<td>$738.00</td>
<td>$619.64</td>
</tr>
<tr>
<td>4</td>
<td>$598.00</td>
<td>$473.67</td>
</tr>
<tr>
<td>5</td>
<td>$477.00</td>
<td>$356.44</td>
</tr>
<tr>
<td>6&amp;7</td>
<td>$982.50 each year</td>
<td>$1,346.04</td>
</tr>
</tbody>
</table>

- Debt Value of leases = $4,396.85 (Also value of leased asset)
- Debt outstanding at The Gap = $1,970 m + $4,397 m = $6,367 m
- Adjusted Operating Income = Stated OI + OL exp this year - Deprec’n
  = $1,012 m + 978 m - 4397 m / 7 = $1,362 million (7 year life for assets)
- Approximate OI = $1,012 m + $ 4397 m (.06) = $1,276 m

The Magnitude of R&D Expenses

R&D as % of Operating Income

- Market: 10.00%
- Petroleum: 50.00%
- Computers: 60.00%
R&D Expenses: Operating or Capital Expenses

- Accounting standards require us to consider R&D as an operating expense even though it is designed to generate future growth. It is more logical to treat it as capital expenditures.

- To capitalize R&D,
  - Specify an amortizable life for R&D (2 - 10 years)
  - Collect past R&D expenses for as long as the amortizable life
  - Sum up the unamortized R&D over the period. (Thus, if the amortizable life is 5 years, the research asset can be obtained by adding up 1/5th of the R&D expense from five years ago, 2/5th of the R&D expense from four years ago...:)

III. One-Time and Non-recurring Charges

- Assume that you are valuing a firm that is reporting a loss of $500 million, due to a one-time charge of $1 billion. What is the earnings you would use in your valuation?
  a. A loss of $500 million
  b. A profit of $500 million

- Would your answer be any different if the firm had reported one-time losses like these once every five years?
  a. Yes
  b. No
IV. Accounting Malfeasance....

- Though all firms may be governed by the same accounting standards, the fidelity that they show to these standards can vary. More aggressive firms will show higher earnings than more conservative firms.

- While you will not be able to catch outright fraud, you should look for warning signals in financial statements and correct for them:
  - Income from unspecified sources - holdings in other businesses that are not revealed or from special purpose entities.
  - Income from asset sales or financial transactions (for a non-financial firm)
  - Sudden changes in standard expense items - a big drop in S,G &A or R&D expenses as a percent of revenues, for instance.
  - Frequent accounting restatements
  - Accrual earnings that run ahead of cash earnings consistently
  - Big differences between tax income and reported income
V. Dealing with Negative or Abnormally Low Earnings

A Framework for Analyzing Companies with Negative or Abnormally Low Earnings

Why are the earnings negative or abnormally low?

- **Temporary Problems**
  - Eg. Auto firm in recession

- **Cyclicality**
  - Eg. A firm in recession

- **Life Cycle related reasons**
  - Young firms and firms with infrastructure problems

- **Leverage Problems**
  - Eg. An otherwise healthy firm with too much debt.

- **Long-term Operating Problems**
  - Eg. A firm with significant production or cost problems.

Normalize Earnings

- **If firm’s size has not changed significantly over time**
  - Average Dollar Earnings (Net Income if Equity and EBIT if Firm made by the firm over time)

- **If firm’s size has changed over time**
  - Use firm’s average ROE (if valuing equity) or average ROC (if valuing firm) on current BV of equity (if ROE) or current BV of capital (if ROC)

Value the firm by doing detailed cash flow forecasts starting with revenues and reduce or eliminate the problem over time:

(a) **If problem is structure**
   - Target for operating margins of stable firms in the sector.

(b) **If problem is leverage**
   - Target for a debt ratio that the firm will be comfortable with by end of period, which could be its own optimal or the industry average.

(c) **If problem is operating**
   - Target for an industry-average operating margin.
